

AGENDA ITEM 5

APPENDIX 1b

2020/0077/MSC

PLANS

Surface Water Drainage Parameters:

Total hardstanding area:	
Roofing =	2,954 m ²
Yard areas =	5,933 m ²
Total =	8,887 m ²
Greenfield run-off (Qbar) =	5.38 l/s
Attenuation required =	580 m ³
Attenuation provided:	
Basin =	611 m ³
Total =	611 m ³ > 580 m ³

Table 1. SUDS Pollution Hazard and Mitigation Indices

Type of Contribution Area	Treatment Component	Hazard & Mitigation Index	Total Suspended Solids	Metals	Hydrocarbons
Roads (low Traffic Roads)	Filter Strip	Hazard	0.5	0.4	0.4
	Filter Drain	Mitigation Index 1	0.4	0.4	0.5
		Mitigation Index 2 (Note)	0.4	0.4	0.5
Total Mitigation Provided (Note 3)			0.6	0.6	0.75
Industrial Roofing: Inert Material	Basin	Hazard	0.3	0.2	0.05
		Mitigation Index 1	0.5	0.5	0.6
	Total Mitigation Provided (Note 3)			0.5	0.5
Other Industrial Site Area	Filter Strip	Hazard	0.8	0.8	0.9
	Filter Strip	Mitigation Index 1	0.4	0.4	0.5
	Filter Drain	Mitigation Index 2 (Note)	0.4	0.4	0.5
	Basin	Mitigation Index 3 (Note)	0.5	0.5	0.6
Total Mitigation Provided (Note 3)			0.85	0.85	>0.95

Pollution Hazard and Mitigation Indexes Note:

- Table 1 shows the total mitigation provided is greater than the Hazard
- In accordance with the SUDS Manual C753 the entire runoff area has been assessed, the SUDS Manual states that where land use varies across the runoff area, the highest pollution hazard within the area shall be used. In this instance the highest pollution hazard is taken as "Other Industrial Site Area"
- A factor of 0.5 is used to account for the reduced performance of secondary or tertiary components associated with already reduced inflow concentrations.

Table 2. SUDS Maintenance Plan

Component	Maintenance Schedule	Frequency	Suggested Personnel
SUDS Basin	Inlet and Outlet Structures Removal of silt and the clearance of grills, gratings of foliage, vegetation, debris and the like and dispose of off site.	Every 12 months	Farm Operatives
	Control Structures/ Inspection Chambers Removal of silt and debris and dispose of off site.	Every 12 months	Farm Operatives
	Litter Removal Routine collection and removal of litter from the basin and inlet and outlet.	Every 12 months	Farm Operatives
	Grass Cutting The grassed basin is to be cut in April and September.	As noted	Farm Operatives
Filter Drain	Outlet Headwall Structures Manually remove silt, foliage, construction debris, rubbish and the like and dispose off site in a controlled manner.	Every 12 months	Farm Operatives
	Inspection Chambers Manually remove silt, foliage, construction debris, rubbish and the like and dispose off site in a controlled manner. Maintain clear of ground cover and scrub vegetation at least 1m offset around the chambers to ensure that they are readily identifiable and accessible.	Every 12 months	Farm Operatives
	Filter Drain Vegetation Clearance Maintain clear of ground cover and scrub vegetation at least 1m offset at either side of the drain to provide a maintenance corridor, and mitigate rootlets penetrating the filter drain geo-textile.	Every 12 months	Farm Operatives
Filter Strip	Litter Removal Routine collection and removal of litter from the filter strip surface.	As noted	Farm Operatives
	Inspection Surface Inspect filter strip surface to identify evidence of erosion, poor vegetation growth, compaction, ponding, sedimentation and contamination. Inspect silt accumulation rates and establish appropriate removal frequencies	Every 12 months	Farm Operatives
	Grass Cutting Cut grass, manage other vegetation and remove nuisance plants.	As noted	Farm Operatives

- Drainage Impact Assessment Notes:**
- The surface water drainage system to be discharge to the existing ditch to the south of the site.
 - The network has been designed to accommodate no flooding up to and including the 200year event + 30% Climate Change.
 - In accordance with the SUDS manual C753, the simple index approach has been utilised to ascertain the total potential pollution hazard.
 - Treatment has been provided as per the mitigation indices from Table 26.3 of the SUDS manual C753. The mitigation provided equals or exceeds the potential pollution index (See Table 1).
 - Mitigation treatment is provided through filter Strips, filter drains and a basin for the yard area and roof.
 - Mitigation treatment is provided through filter strip and filter drain for the access track.
 - Attenuation provided to control the discharge from the development to Greenfield Runoff (Qbar) of 5.38 l/s.
 - A HR Wallingford Storage estimation assessment of the potential attenuation volume required has been carried out using IH124 Method and the volume required assessed as 580 m³.
 - A review of the Water Environment (Controlled Activities) (Scotland) Regulations 2011 demonstrates that this development shall not require SEPA licence to discharge, as the surface water is installed and maintained in accordance with GBR 18, 19, 20 and 21 of the CAR Regulations.
 - There are no Scottish Water foul, surface water or combined sewers in the vicinity of the proposal.
 - Office facility WC and associated facilities foul drainage to be discharged to septic tank with outfall to drainage field sized in accordance with BS 6297:2007.
 - Building roof area water to be collected and discharged directly to the SUDS basin and attenuation provided within the basin to Greenfield Run Off equivalent.
 - Farm yard area surface water to be collected in filter strips/filter drains and discharged to the SUDS basin and with attenuation provided within the basin to Greenfield Run Off equivalent.

Notes:

1. Refer to "Sewers for Scotland, 4th Edition" for typical details of manholes with depths from cover level to soffit of pipe not exceeding 6m. No significant departure from these shall be made without the approval of Highland Council. Types D&F need the agreement of Scottish Water. Manholes should be designed and constructed in accordance with BS EN 752-3.
2. Manhole diameter to be as follows:
1200mmØ (Pipe Ø up to 375mm.)
1500mmØ (Pipe Ø > 375mm up to 700mm.)
1800mmØ (Pipe Ø > 750mm up to 900mm.)
3. Manhole construction to be in accordance with "Sewers for Scotland, Fourth Edition", (SFS4).
4. Manhole covers and frames to be in accordance with SFS4 sub-section 5.2.30.
5. Rocker pipes shall be provided at entry to and exits from manholes. Their length shall be as shown in the Table in sub-section 5.6.6 of SFS4.
6. Where step rungs and ladders are to be used top-step rungs are to be located not less than 500mm and not greater than 700mm from the finished manhole cover level with a minimum of two courses of brickwork.
7. Chambers more than 450mm in depth have to have one or more step rungs or toe holes and 25mm diameter solid bar handrail to be provided to the benching.
8. Where no step rungs are to be used, there shall be between two and four courses of brickwork under cover.
9. Refer to SFS4 sub-section 2.20.7 for minimum clear access opening sizes and requirements for fittings.
10. Pipes of different diameters entering manholes shall be installed with soffits at the same level.
11. Clause numbers to the Specification for Highway Works (S.H.W.)
12. Pipe materials shall be in accordance with part 4 Sewers for Scotland 4th Edition.
13. The use of perfect manhole or similar precast base units shall be precluded without the express consent of the engineer.

Mound Filter System

Calculations to BRE Digest No. 478, Mound Filter Systems for the Treatment of Domestic Wastewater

Vp from percolations text results = 186.9

Minimum Basal Area

$At = P \times Vp \times 0.25$

P =	Population Equivalent	6
Vp =	Percolation value of the native soil (s/mm)	186.9
At =	Area	280.3 m ²

Minimum Distribution Layer Area

$Ad = P \times Vf \times 0.25$

P =	Population Equivalent	6
Vf =	Percolation value of filter material (s/mm)	35
Ad =	Distribution layer area (m ²)	52.5 m ²

Length of Pipework within Distribution Layer

Ad =		52.5
Pipes =	Adopt 5 pipes	5
Length =	Length of each pipe	10.5 m

Assuming 6.0m distribution layer width.

Therefore Width between pipes 1.2 m

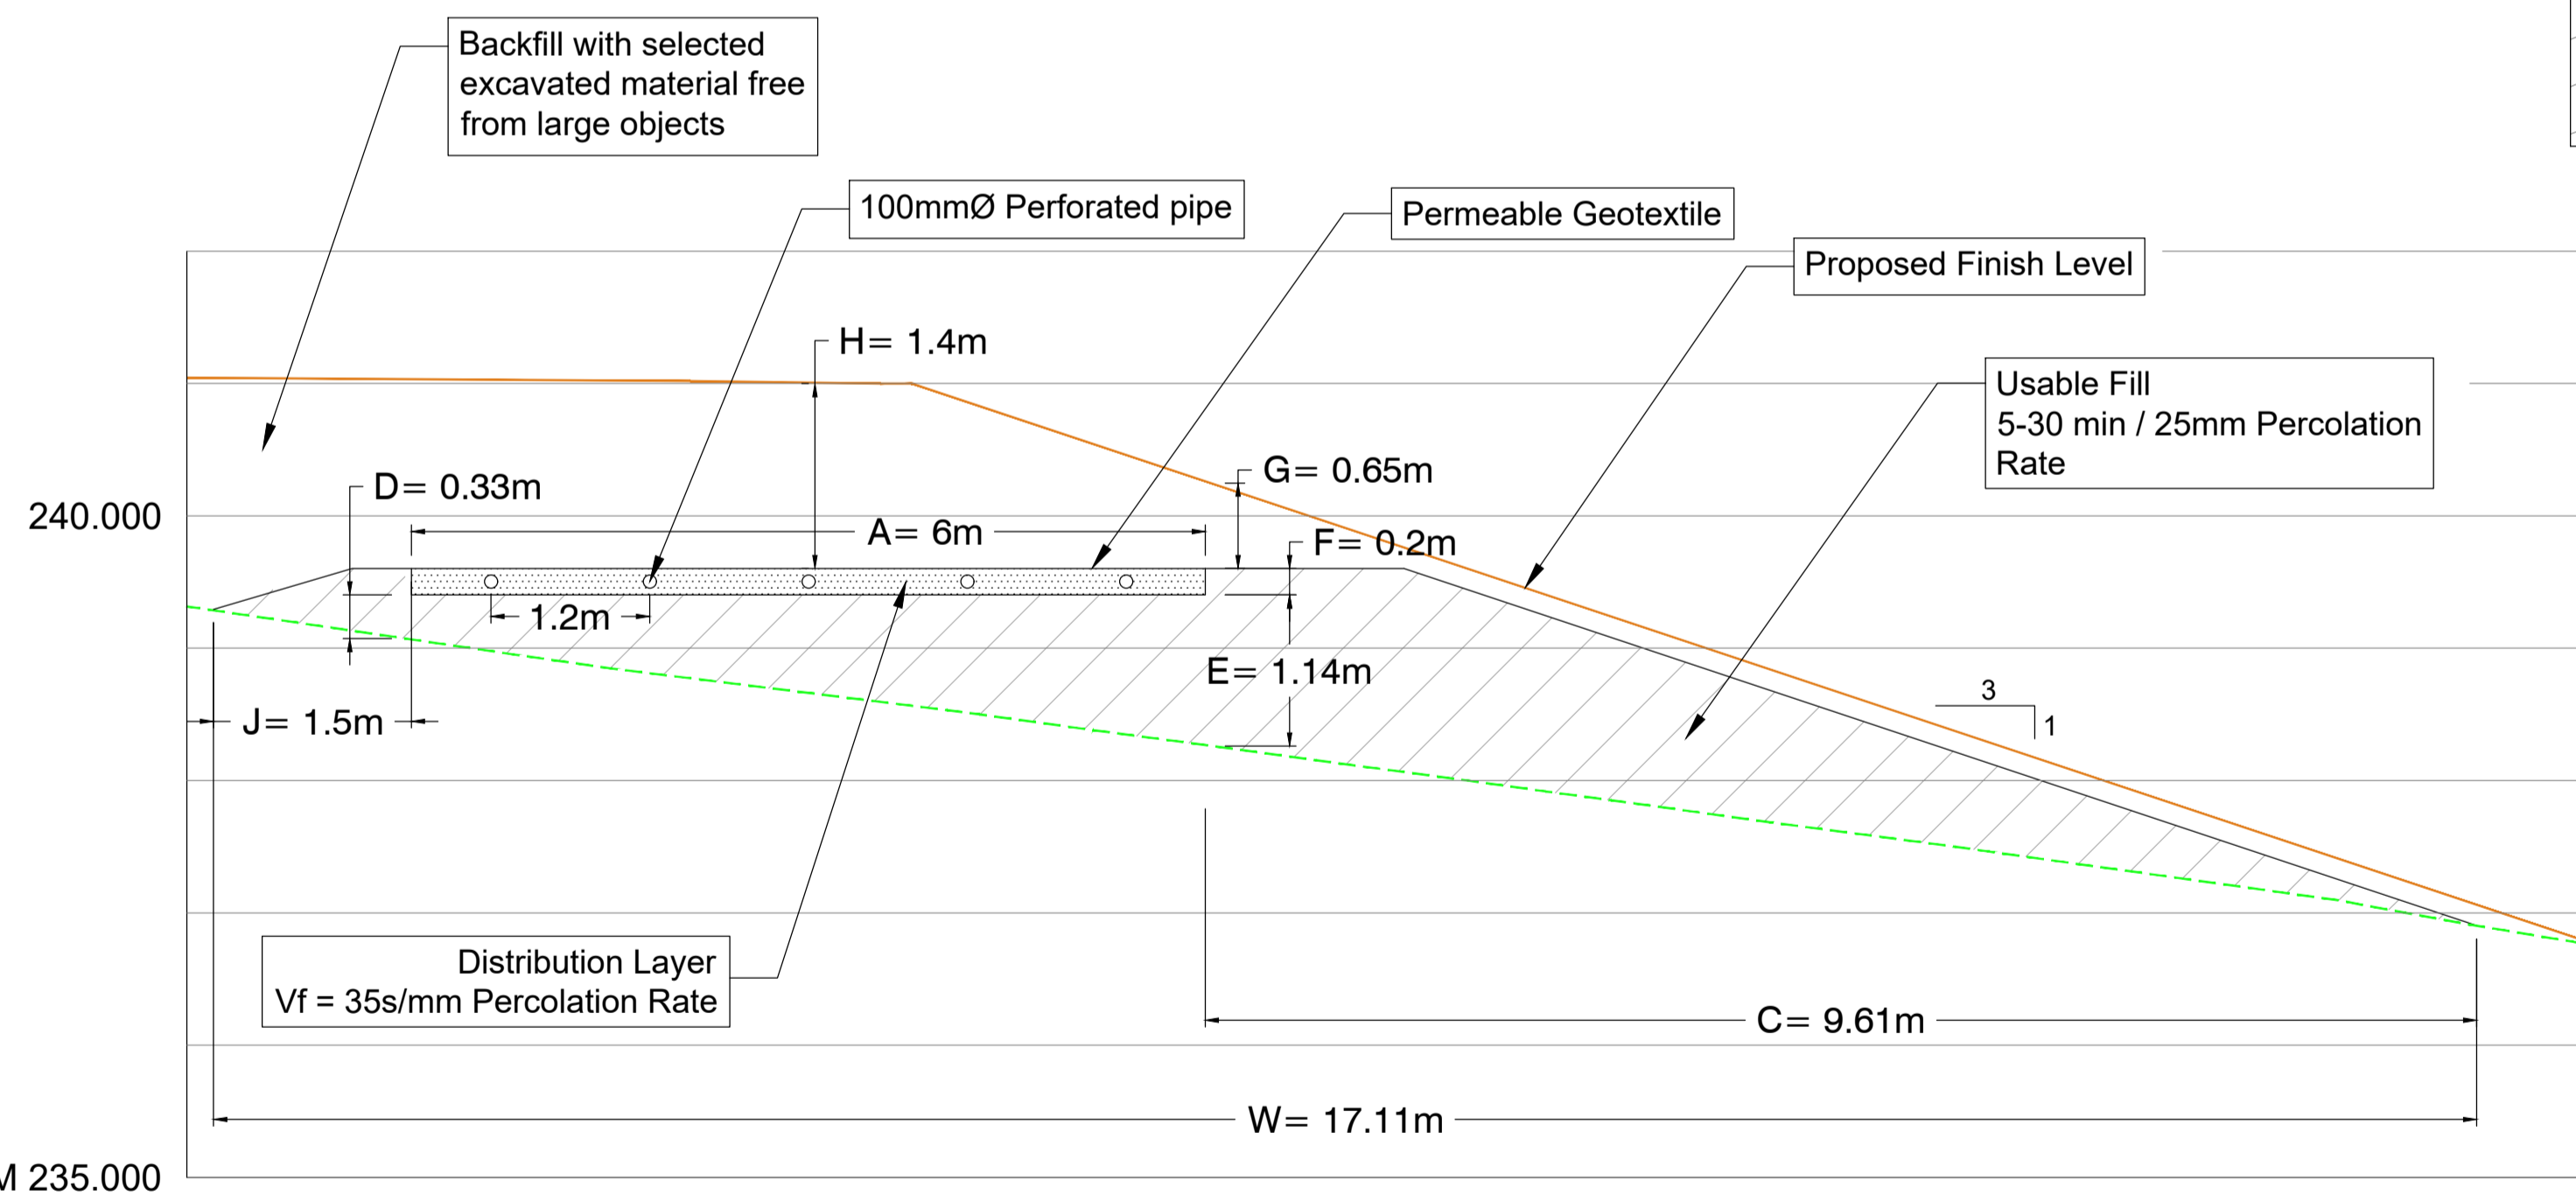

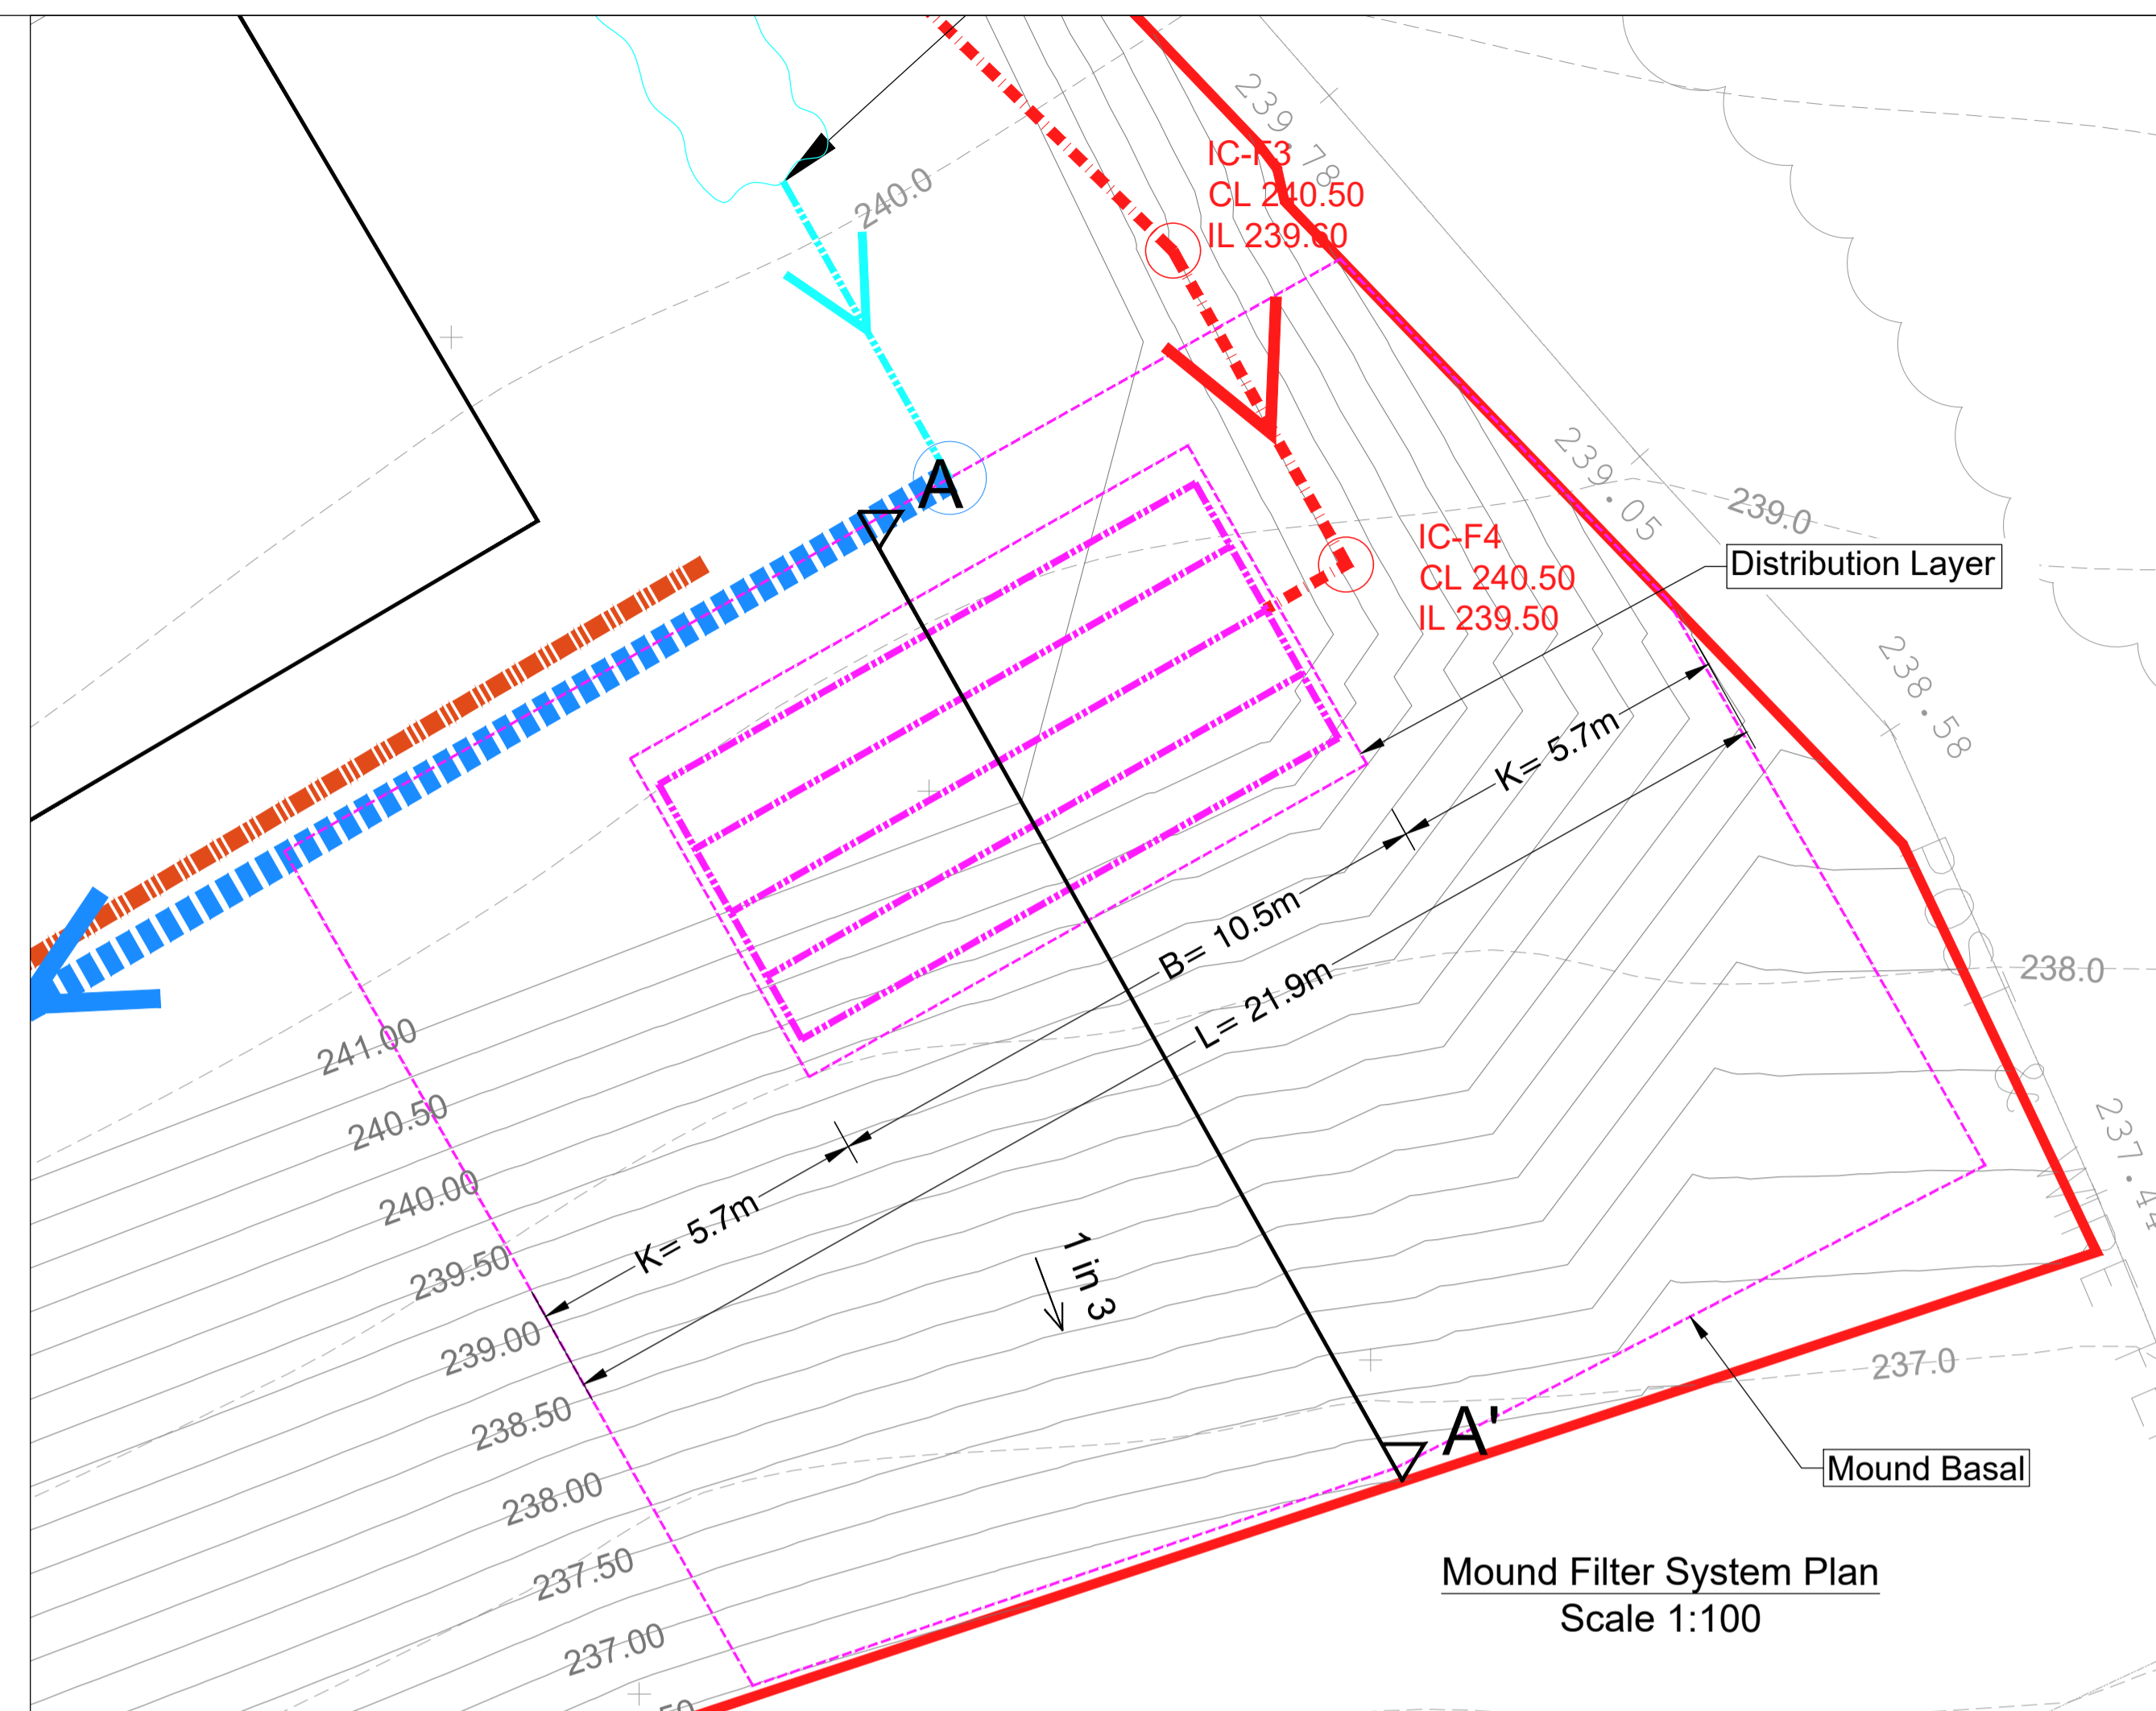

Therefore distribution layer area = 10.5 m x 6.0m = 63.00 m²

Resultant Mound Dimension

The resultant dimension meet the critical dimension for distribution layers bed as per BRE 478 - Fig 14 and Figure.

A =	Distribution layer width	6.00 m
B =	Distribution layer length	10.50 m
C =	Downslope taper	9.61 m
D =	Depth of filter material at the upslope edge	0.33 m
E =	Depth of filter material at the downslope edge	1.14 m
F =	Depth of gravel in the distribution layer	0.20 m
G =	Depth of the cover at the upslope and downslope	0.30 m
H =	Depth of cover at the centre of the distribution layer	1.40 m
J =	Upslope taper	1.50 m
K =	Sideslope taper	5.75 m
L =	Total length of mound [B+2K]	21.90 m
W =	Total Width of the Mound [A+C+J]	17.11 m
X =	Total height of mound H+J+[(D+E)/2]	2.34 m

Ad =	Distribution Layer Area	63.0 m ²
At =	Mound Basal Area (L X w)	371.5 m ²
X =	Height	2.3 m ²

Chainage	0.000	2.000	4.000	6.000	8.000	10.000	12.000	14.000	16.000	18.000
Existing Ground Level	239.316	239.022	238.749	238.499	238.226	237.955	237.680	237.410	237.131	236.787
Proposed Level	241.051	241.034	241.018	241.002	240.797	239.987	239.178	238.398	237.622	236.845

Mound Filter Cross Section A-A'
Scale H 1:50
V 1:50

Notes

- The area required for the mound shall be fenced to avoid traffic and constructions. This will prevent disturbance, scalping or compaction of the mound.
- The septic and infiltration system shall be inspected annually.

Wash Bay Reed Bed Sizing Calculations

Sizing based on the Recommendations from BRE Publication 'Reed Beds for the Treatment of Domestic Wastewater'

Recommended size of reed bed = 5m² / PE

Calculation of Flow

Pressure washer with a flow rate of 10 litres per minute.

Assume 5 minutes per wash

Therefore flow = 10 x 5 = 50 litres per wash

Hose with a flow rate of 20 litre per minute

Assume 5 minutes per wash

Therefore flow = 20 x 5 = 100 litre per wash

Therefore size for hose wash

Assume 3 Wash per day

Therefore flow per day = 3 x 100 = 300 litre per day

Calculation of Population Equivalent

Flow for one person = 180 litre per day

Therefore PE equivalent = 300/180 = 1.7 = 2 Persons

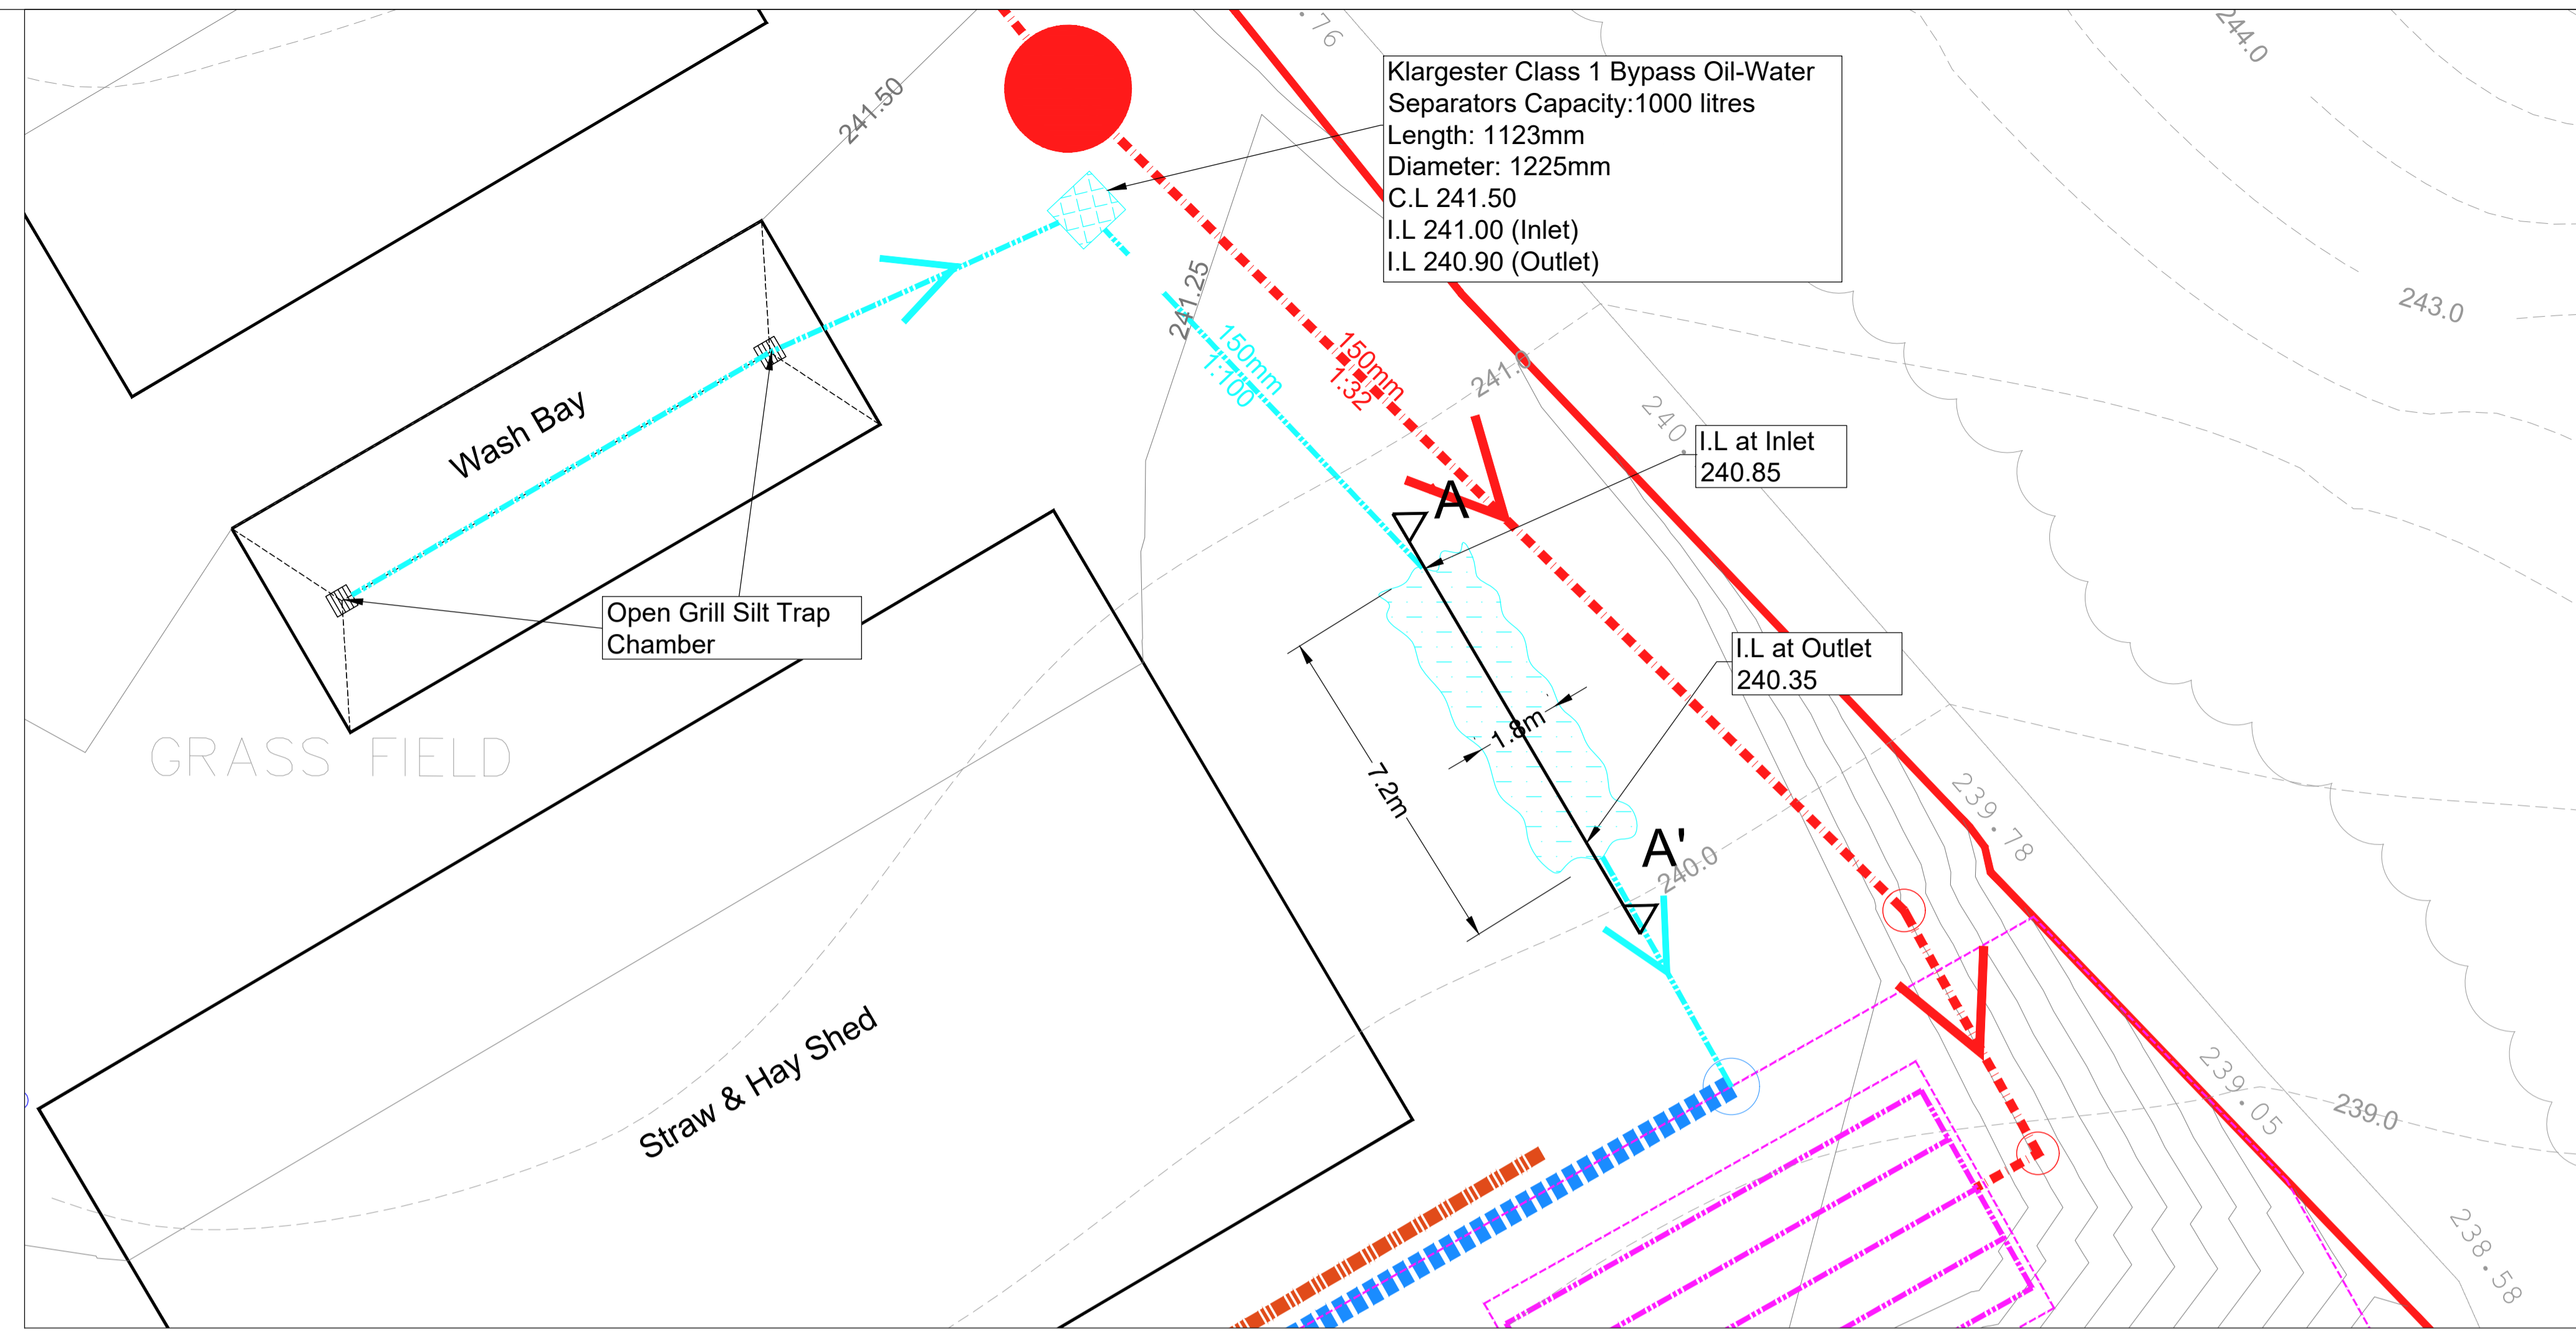

Sizing of Reed Bed

Recommendation Size = 5m² / PE

Therefore minimum reed bed area = 5 x 2 = 10m²

Recommended length to width ratio for a reed bed 4:1 for PE ≤ 30

Therefore adopt reed bed 7.2m x 1.8m (13 m²)

Klargester Class 1 Bypass Oil-Water Separators Capacity:1000 litres

KEY

-  Site Boundary
-  Proposed Stockproof Post & Wire Fencing
-  Proposed Gate
-  Proposed Lighting Location

Notes:

1. Proposed lighting to be fitted with passive infrared sensor (PIR) to minimise energy use when not required.
2. Proposed floodlight to be fitted with brackets to allow lights to point downwards to illuminate the ground plane avoiding over exposure of light on the surrounding environment.
3. Proposed lighting ensure the safe use of building, works with livestock and farm machinery.
4. Lighting shall not be placed on the south elevations of the sheep shed and cattle building to avoid light spill towards the A9.
5. For external appearance of buildings (elevations and cross sections) refer to Algo drawings E18-062/PL_01 to PL_04.
