- Frequent
- Occasional
- Rare
- None

The Beaver Dam Capacity (BDC) model estimates the capacity of river systems to support dams at the reach-scale (c.a. 150m) based on the hydrology and vegetation of that section of the river. BDC is graded as: None, Rare, Occasional, Frequent, Pervasive. This dataset was created by Campbell-Palmer, Puttock and Brazier (2023) as an accompaniment to the report "Beaver Dam Capacity and Habitat Suitability: Spey Catchment, Scotland".
